Professor Michael O'Neill

Oct. 18, 2025

Artificial Intelligence is an ever-growing technology, especially in the field of cybersecurity. When it comes to cybersecurity, especially the hacker side of things, there are white hat hackers and black hat hackers. White hat hackers are the hackers that help companies detect problems in their security so that malicious hackers cannot easily break through. Black hat hackers are the hackers that work for the government and send malware and other problems to others who intend to do harm. There are several jobs that come with cybersecurity, but this paper will focus on the positive impact of AI on the forensics side of cybersecurity. It will also discuss ethical issues with using AI, one of the methodologies surrounding AI, how a Christian Worldview views AI, and how the ACM and IEEE codes of ethics view AI.

The integration of AI impacts the forensics side of cybersecurity in many positive ways. Some of the ways AI impacts forensic cybersecurity are through malware analysis, log analysis, data recovery, phishing detection, anomaly detection, and many others (Kasa, 2025). According to Kasa, when it comes to malware, "AI breaks viruses into components so as to identify their actions, sources, and consequences, which is helpful in designing ways to combat the viruses" (Kasa, 2025). AI can search through large log files and find anomalous patterns (Kasa, 2025). It can aid in reconstructing stripped off files and corrupted or fragmented media (Kasa, 2025). According to Rouch, another positive impact of AI affecting forensic cybersecurity is, "the implementation of robust AI models into digital forensic software and toolsets will likely result in significant improvements in the ability to categorize and filter files and file contents" (Rouch, 2024). He also says that AI can reduce the time analyses take, which will help with reducing potential wait times backlogs (Rouch, 2024). AI is a helpful and useful tool that has positively affected forensic cybersecurity in many ways.

While AI is a powerful tool that contributes positively in many ways, with great power comes great responsibility. AI itself, in hindsight, is not unethical. However, it becomes unethical when humans misuse it. According to the Penn State method of ethics, “machines (and computers) can be programmed to do things we consider ethically right” (Penn State). This confirms that if people can program AI to do things ethically right, people can also program AI to do things considered unethical as well. It also shows that AI is not the one that is unethical, but it is solely on human shoulders. One problem with AI is that it is discriminatory, giving privileged people systematic advantages and underprivileged people systematic disadvantages (Stryker & Kavlakoglu). Another problem is that if someone solely uses AI, then they are not truly doing their job; it is simply an “easy” button (Roush, 2024). This is technically a form of stealing, as you are relying solely on work that is not yours. AI should be tool to get started or help, not do the entire job for someone. The most significant problem with AI is that it is not always accurate. Roush states, “Tool and software can and do get it wrong. Just because your AI-infused software found evidence doesn’t mean it is valid or accurate” (Roush, 2024). If people do not catch the mistakes AI makes or uses the incorrect data knowingly, it is extremely untruthful and unethical. AI itself is not unethical as it is simply a robot made by humans; it is the humans themselves that make AI unethical.

The Christian Worldview agrees with some of the ethical issues brought up earlier. AI is simply a robot, so it cannot technically sin. However, humans can use it in sinful ways. The first problem brought up was discrimination. In Matthew 22:39, Jesus tells us to “love your neighbor as yourself” (Matt. 22:39). AI does not follow this rule when it exhibits these discriminatory behaviors. An obscure problem that arises with AI is stealing. In Exodus 20:1-17, the Moses was given the Ten Commandments, and one of them warns us to never steal (Ex. 20:15). If humans in

cybersecurity continuously use AI and claim the work as their own, that is untruthful and technically stealing. Even though it is not stealing from a fellow human being, it is still taking something that does not belong to the programmer from somewhere else. Another issue revolving around Christianity and AI is treating AI as an idol. There are several places in the Bible that tells the Lord's people to love the Lord and not put anything above Him. Matthew 22:37 says, "Jesus replied: 'Love the Lord your God with all your heart and with all your soul and with all your mind' (Matt. 22:37). Sometimes, however, people may start viewing AI as an idol. AI is a useful and wonderful tool, but it is also not perfect and cannot do what God can do. This does not stop people from treating it like it is, and maybe even worshipping it. These are some of the ways that the Christian Worldview sees ethical issues with how humans use AI.

The ACM and IEEE codes of ethics also have some ethical issues with the use of AI. According to ACM's general ethics, there are seven rules that professional computers must follow. Some of these include contributing to society, avoiding harm, being honest and trustworthy, being fair and never discriminating, respecting the work others do, respecting privacy, and honoring confidentiality (ACM, 2018). The IEEE code of ethics basics say, "to uphold the highest standards of integrity, responsible behavior, and ethical conduct in professional activities," "to treat all persons fairly and with respect, to not engage in harassment or discrimination, and to avoid injuring others," and "to strive to ensure this code is upheld by colleagues and co-workers" (IEEE). The ACM code of ethics addresses most of the issues brought up earlier in the paper. It says to be honest and trustworthy, and the ethical issues of stealing and using faulty data fall under. Both codes of ethics explain to never discriminate, and humans can easily get AI to discriminate against others. Both codes of ethics are important to uphold whenever in the workplace.

Despite being completely different sources, the Christian Worldview and the codes of ethics share similar opinions on the ethical issues presented in the paper. All three agree that people should be honest, trustworthy, and fair. Of course, the codes of ethics explain more specific details as they specialize in ethics specifically for AI. The Bible, on the other hand, has the code of ethics for how to live. However, because many of the ethics behind AI is human based, the Bible is able to give a decent view into AI ethics. The Bible, ACM, and IEEE all do a wonderful job of thoroughly addressing the ethical issues presented in this paper.

There are many ethical issues when it comes to humans using AI. However, there are many solutions to these problems. The solution to the problem with AI is not simply to ban it. As discussed, AI is an extremely helpful tool when used properly. One solution is to limit the use of AI. With limited use and access to AI, it is harder to steal the work completely as it will truly function as it is meant to, a tool to guide and help. Humans can continue to work on and improve AI so that it is more accurate and makes less mistakes. This will also help with the discrimination problem. Another solution is to monitor everyone when they use AI. This, however, is unethical as well because it is technically invasion of privacy.
